

How the Companies Operate

The group structure, company isolation, shared modules, access model, operating profiles, inter-company rules and consolidation.

Purpose

A business-owner view of how six companies run inside one system without mixing legal books or operational responsibility. This guide describes the system as audited on 27 July 2026. It explains current capability, control points, and the difference between built functionality and live onboarded data.

1. Owner's executive picture

Audit verdict

The workflows described in this guide are implemented in application code and covered by the current automated suite. The suite passed again during this documentation audit: 199 tests and 999 assertions.

Readiness warning

The local database is foundation-ready but not operationally onboarded. It currently has no employees, payroll runs, projects, parties, journals, invoices, inventory movements, bank accounts, tax codes, or opening balances. Real company data, approval limits, bank details, tax configuration, contracts, and opening balances must be loaded before live use.

Roman Urdu bottom line

Sab companies aik hi system use karti hain, lekin har company ka data, approvals aur Accounts separate hain. 7-Orbit ke neeche IT aur Medical Billing children hain; YM Construction, BMC aur BMC Trading independent roots hain. Consolidation report books ko combine karti hai, ledgers ko merge nahin karti.

Confirmed organization

Company	Parent	Operating profile	Current position
7-Orbit	None	Generic	Independent root and transaction-capable parent.
7-Orbit IT	7-Orbit	IT Services	Direct child; modules inherit from parent.
7-Orbit Medical Billing	7-Orbit	Medical Billing	Direct child; modules inherit from parent.
YM Construction	None	Construction	Independent root.
BMC	None	Generic	Independent root; exact business specialization remains configuration-led.
BMC Trading	None	Trading	Independent root; not assumed to be a child of BMC.

Legal structure rule

Names do not create hierarchy. BMC Trading remains independent unless the business explicitly changes its parent. The system blocks circular company structures.

2. One application, separate company books

Shared across the platform	Separate for every company
One Laravel / Filament application	Operational records and document ownership
One shared database and controlled codebase	Chart of Accounts snapshot and system mappings
One standard account template	Financial years, periods and voucher numbering
One reusable HR, Accounts, Projects and Documents implementation	Customers, vendors, employees, projects, sites and inventory
One permission catalog and role templates	Membership, access scope and approval evidence
Group reporting logic	Cash/bank, payroll postings, assets and legal-company books

What shared does not mean

A shared database never means shared visibility. Company ownership is checked in tenant queries, relationships, policies, actions, reports, exports and tests.

3. Access and responsibility model

How a user enters a company

- A normal User needs an active membership in an active company.
- A membership can optionally grant access to active descendants.
- Direct membership alone does not automatically grant child-company access.
- A super-admin can access all active companies but still uses explicit company context.
- Roles are reusable global permission templates; membership decides which companies the User can enter.
- The current design does not assign a different role to the same User in each company.

Current local access readiness

Item	Current local state	Business implication
Users	2	Only a minimal administrative environment exists.
Roles	2	Super admin and Manager role records exist.
Company memberships	1	Operational company access has not been fully assigned.
Permissions	585	Fine-grained capability and workflow permissions are provisioned.
Employees	0	System Users and HR Employees remain separate.

Owner decision needed

Before live use, approve a responsibility matrix: who prepares, reviews, approves, posts, pays, reconciles, closes and reports in each company. Then assign memberships and least-privilege roles.

4. Module governance

The shared module catalog contains Document Management, Human Resources, Accounts and Projects. Root companies currently have all four enabled. The two 7-Orbit children inherit their module state from 7-Orbit.

Module state	Meaning	Current use
Enabled	The company explicitly turns the module on.	All four root companies.
Disabled	The company explicitly turns the module off.	Available as a control; none currently disabled.
Inherit	The child follows its parent setting.	7-Orbit IT and 7-Orbit Medical Billing.

Variation without duplicated software

If companies need different wording, templates, mappings or workflows, the variation belongs in company configuration or a named variant. The system should not create a separate copy of HR or Accounts for each company.

5. How each company operates day to day

Maintain company master data	>	Create operational documents	>	Independent approval	>	Perform receipt / delivery / work
Post financial effect	>	Settle through cash or bank	>	Reconcile subledgers	>	Review company reports

Layer	Typical activity	Accountability
Company setup	Legal profile, bank accounts, module state, accounting profile, periods and mappings.	Company administrator plus Finance oversight.
Master data	Departments, designations, parties, items, tax codes, projects, sites, budgets and asset categories.	Operational owner with company-scoped approval.
Transactions	Hiring, payroll, PR/PO, GRN, Vendor Bill, inventory, Sales, Treasury and assets.	Maker enters; checker approves; specialists perform receiving, inspection or matching.
Accounting	System-generated or controlled manual journals, reversals, period control and opening balances.	Authorized Finance roles.
Reports	Company financials, subledgers, project profit, treasury, payroll and assets.	Company management and authorized group management.

6. Operating profile by company

Company / profile	Primary commercial flow	Key accounting focus
YM Construction	Project budget -> procurement -> site receipt -> material issue -> running bill -> receipt.	Project dimensions, direct costs, retention, mobilization, site inventory and certified revenue.
BMC Trading	Purchase stock -> receive -> Vendor Bill -> sell stock -> collect.	Inventory, moving weighted-average, Sales, COGS, AP and AR.
7-Orbit IT	Service delivery -> service invoice -> receipt.	IT service revenue, cost centers/projects where used, payroll and receivables.
7-Orbit Medical Billing	Billing service -> service invoice -> receipt.	Medical billing service revenue, operating cost and receivables.
7-Orbit	Generic operational transactions plus parent reporting scope.	Separate own books; authorized consolidation with descendants.

Company / profile	Primary commercial flow	Key accounting focus
BMC	Generic transactions until the business approves a more specific profile.	Standard books and configuration-led activation.

Profiles activate relevant accounts

Every company still receives the same 101-account snapshot for reporting consistency. The profile activates the accounts relevant to its operations; it does not force all companies to use every account.

7. Parent and child behavior

Question	System answer
Can 7-Orbit IT post its own business?	Yes. It is a transaction-capable legal company with its own accounts, periods, vouchers and operational data.
Does 7-Orbit automatically see child data?	Only an authorized User with descendant access and the relevant permissions can enter child-company scope.
Does child access merge books?	No. Each transaction remains in the selected company's ledger.
Can parent settings flow down?	Yes. Module states can be inherited. Other operational differences use explicit configuration.
Is there an All Companies tenant?	No. Consolidation is a report scope, not a company record.

8. Inter-company business

- A transaction identifies the origin and counterparty companies, date, direction, amount, offset accounts and evidence.
- The preparer cannot approve or post it.
- Each company side requires a different approver.
- Both companies must have valid due-from/due-to mappings and Open periods.
- Posting creates linked, balanced journals in both books in one database transaction.
- If either side fails, neither side posts.
- Reversal also affects both books atomically and retains the original evidence.

Example

If 7-Orbit pays a cost on behalf of 7-Orbit IT, the origin book records an amount due from the child and the child book records an amount due to the parent. Consolidation later eliminates the internal pair, while each legal book remains complete.

9. Consolidated group reporting

Group consolidation starts from a real parent company and includes its active descendants. The User must be authorized for every included company. Accounts are mapped through the controlled template/reporting keys, not by loosely matching names.

Output	What management sees
Consolidated Trial Balance	Combined debit/credit balances with internal eliminations and mismatch indicators.

Output	What management sees
Consolidated Balance Sheet	Group assets, liabilities and equity after internal due-from/due-to elimination.
Consolidated P&L;	Group revenue and expenses by controlled reporting mapping.
Inter-company reconciliation	Origin/counterparty differences that must be resolved before relying on consolidation.
CSV export	Streamed group Trial Balance for authorized analysis.

Current consolidation scope

The confirmed reportable hierarchy is 7-Orbit with 7-Orbit IT and 7-Orbit Medical Billing. YM Construction, BMC and BMC Trading are separate roots, so they are not automatically part of the 7-Orbit descendant consolidation.

10. Group governance model

Responsibility	Company level	Group level
Data ownership	Own employee, party, project, inventory, bank and transaction records.	Defines shared standards and required master-data quality.
Approval	Approves its own operational and financial documents.	Defines role templates, limits and segregation standards.
Books	Maintains its own GL, periods, vouchers, subledgers and reconciliations.	Maintains account template and consolidation mapping.
Reporting	Reviews its own performance and balances.	Reviews consolidated reports and cross-company exceptions.
Inter-company	Confirms its own side of every transaction.	Monitors reconciliation and elimination.
Security	Grants company membership to operational Users.	Controls super-admin, sensitive permission and descendant-access governance.

11. Current readiness: built versus onboarded

Area	Built capability	Local live data now
Company foundation	Hierarchy, memberships, module inheritance, bank security and profiles.	6 active companies; 1 membership; 0 bank accounts.
HR	Employee, Employment, documents, joining, compensation and payroll.	0 employees, employments and payroll runs.
Accounts	COA, mappings, periods, ledger, workflows and reports.	606 accounts and 126 mappings; 0 journals/opening balances.
Operations	Projects, budgets, procurement, inventory, AP, Sales and Treasury.	0 parties, projects, orders, receipts, bills, invoices or payments.
Group finance	Inter-company, consolidation, year close, migration and recovery checks.	0 inter-company transactions, closings or opening migrations.

Meaning

The software workflow is ready for controlled onboarding, but the organization is not yet running its real business books in this local database. Do not treat zero balances as verified company balances.

12. Recommended company onboarding sequence

Confirm legal and hierarchy data	>	Assign Users and roles	>	Enter company banks
Approve tax and workflow settings	>	Load company master data	>	Validate opening balances
Run sample end-to-end cycles	>	Reconcile and sign off	>	Open live operation

Wave	Recommended scope	Exit evidence
1 - Governance	Companies, legal data, hierarchy, memberships, roles, modules and sensitive permissions.	Owner-approved access matrix.
2 - Finance foundation	Banks, tax/deduction codes, approval limits, accounting settings, mappings and opening source.	Accountant-approved configuration and validated dry run.

Wave	Recommended scope	Exit evidence
3 - Operating masters	Employees, parties, items, projects, sites, budgets, documents and assets.	Company owner data-quality sign-off.
4 - Parallel operation	One complete purchase, sale, payroll, inventory and bank-reconciliation cycle.	Subledgers and GL reconcile; exceptions documented.
5 - Go live	Import approved opening balances, authorize live periods and lock migration evidence.	Formal business and finance approval.

13. Decisions and boundaries the owner should retain

- BMC Trading is not a BMC child unless the business formally changes the hierarchy.
- 7-Orbit is transaction-capable, not merely a fake consolidation entity.
- PKR is the only approved currency scope at present.
- Live statutory tax and deduction rates must come from approved business/accountant configuration.
- Roles are shared templates; company membership is the access boundary.
- Operational approval does not automatically create an accounting entry.
- Posted history is corrected by reversal, never by silent editing.
- Consolidation is a report; it does not merge legal books.
- Actual backup scheduling and restore execution belong to deployment operations, while the application provides integrity and recovery evidence.

Owner's final picture

Think of the platform as one secure building with six company offices. They share infrastructure and operating standards, but each office has its own files, cash, approvals and books. Authorized group management can view a combined report, yet no legal company's history is mixed or overwritten.
